FILMMIC FOUNDATIONS

Publication and AI Authoring Standard

Edition 3.0 | 24 October 2026 | Standalone AI handoff summary

Purpose: A context-free AI with the supplied source site and appropriate research/media tools should be able to research, write, design, test, and package ONE new film-analysis article without access to previous chats. The Markdown standards and real current website source are authoritative; this PDF is the concise human-readable companion.

1. Non-negotiable output

- **Film:** a real short film; confirm exact cut, release year, verified credits and runtime from the original and reliable production records.
- **Article:** 20–30 minutes of substantive close analysis at 225 words/minute (roughly 4,500–6,750 body words); original, qualified thesis and evidence-led prose.
- **Sources:** minimum 10 *verified, distinct and relevant* sources, including primary, secondary and tertiary; 15–20 preferred. Primary film always included.
- **Media:** 7–15 unique authentic local stills, with real JPEG and 640px version, intrinsic dimensions, alt text and captions. Exactly six film stills in preview (no diagrams).
- **Figures:** each still supports a nearby analytical claim; original analytical diagrams are static and non-clickable. PDF uses exactly the same figures and numbering.
- **Publication:** anonymous archive organization named Filmmic Foundations. Preserve existing site design, headers, filters, viewers, teal palette and Light/Dark/System Settings.
- **Handoff:** one article-only ZIP, separate complete illustrated PDF and QA report. Never auto-publish; operator approves GitHub update.

2. Source hierarchy and citation discipline

Source categories

- **Primary:** original film, firsthand production notes/credits, direct filmmaker interview, official first-party records for relevant verified claims.
- **Secondary:** independent scholarship, film criticism, research books/articles or documented reporting interpreting the film or its context.
- **Tertiary:** film catalogs, encyclopedias and reference summaries for limited background/metadata, not unique scientific findings or filmmaker intent.

Citation rules

- Read every source you cite and record precise author/title/venue/date/link and exact claim it supports in `research/sources-ledger.json`. No invented sources or inflated source counts.
- Numbered citations must be clickable and occur **immediately after the specific supported sentence** throughout a paragraph, not as a group at its end. HTML uses `href="#ref-N"`; PDF uses internal destinations.

- Film observations, contextual findings and interpretations are distinct. Do not use outside psychology/science to diagnose characters or prove subjective symbols.

3. Frame and diagram rules

- Watch the entire actual film with audio. Create a scene/timestamp log and source/rights record; verify every still against the correct cut.
- Export full-frame genuine stills at native source resolution as local JPEGs; do not create fake film frames or upscale to assert invented detail. Derive `-640.jpg` responsive variants.
- Hero cover, archive card, social preview, first homepage preview slide and PDF cover use the same chosen genuine frame.
- For each film still: figure number, timestamp, filename, alt text, caption, analytical role and exact article section. Reuse still across surfaces appropriately but avoid duplicates in article body.
- Original HTML/CSS analytical diagrams explain specific formal relationships. They do not enter the still-image viewer or the archive preview gallery.

4. The film-analysis PDF

Use the actual **Mindglass Procedure** PDF in the site snapshot as the visual template; do not follow a film-specific essay argument just because it is in the example.

- First page: left-aligned title and subtitle, thin teal rule, genuine frame and caption, short introduction and compact four-row, two-column film facts table.
- Second page: unlinked **Contents & research method** section. Keep section contents plain; no clickable TOC destinations.
- Body: entire website article prose, figure identities, figure numbers and section order unchanged. PDF cannot silently abridge analysis or move figures to a separate appendix.
- In-body source citations are live internal links, bibliography URLs remain clickable, publication metadata credits the archive, fonts/text selectable, page numbering/running headers consistent.
- Render every page to PNG and inspect typography, figures, overflow, captions and references before publishing.

5. Website consistency

- Preserve existing homepage design, article cards, search/filter/sort and four layout modes. Do not overwrite root `index.html` with the new film article.
- Reuse shared navbar, article toolbar, Settings, viewer, share menu and PDF/download behavior from current site CSS/JS; no duplicate modal implementations.
- Image viewer centered on screen at desktop, mobile and landscape; dialogs dim menus, lock background scrolling, open/close cleanly and support keyboard/reduced motion.
- The verified film Watch section is followed by **Suggested Articles** as last body section before footer.
- Original design palette: cream / deep teal. Reader theme options Light, Dark, System; no optional selectable accent-color palette.

6. The release procedure

- **1.** Unpack latest source site to working copy (kit has a snapshot; newer provided source overrides). Read all v3 Markdown guides and actual Mindglass and Spring examples.
- **2.** Verify film, 10+ evidence-bearing references of all 3 classes, scene/timestamp log and licenses. Draft 20–30 minutes of source-specific analysis.
- **3.** Choose 7–15 genuine stills and exactly 6 preview images, add figure captions/alt/rights, build HTML and PDF from same manuscript and figure map.
- **4.** Run `python3 scripts/build_archive.py`, `python3 scripts/quality_gate.py`, media manifest check and `python3 scripts/preflight_new_article.py slug`.
- **5.** Test actual webpage and image viewer in Chromium desktop/mobile light/dark; render and visually inspect all PDF pages; simulate ZIP review.
- **6.** Run `python3 scripts/package_article.py slug`. ZIP must contain only `slug/...` files, not the home or this authoring kit. Operator reviews and publishes; verify GitHub Actions and live direct URL.

7. Stop-ship conditions

If a required film file, source class, 10-source floor, 7–15 authentic stills, PDF parity, browser test or safe packaging cannot be verified, label output **EDITORIAL / TECHNICAL DRAFT — NOT READY TO PUBLISH**. Do not claim tests or live deployment that did not happen. Deliver clearly described partial work rather than fabricated substitutions.
